CC The present invention describes chimeric antibody (Ab) heavy (H) chains CC containing the variable region of the H chain of a mouse monoclonal Ab CC recognising human tissue factor (hTF) and the constant region of the H CC chain of a human Ab. The variable region is one of six specified CC sequences (which are the H chain variable regions from mouse monoclonal CC Ab's ATR-2,3,4,5,7 or 8). Also described are chimeric Ab light (L) CC chains containing the variable region of the L chain of a mouse monoclonal Ab recognising human tissue factor (hTF) and the constant CC region of the L chain of a mouse conclonal Ab recognising human Ab, the variable regions being one of six Specified sequences (which are the L chain variable regions from mouse CC monoclonal Ab's ATR-2,3,4,5,7 or 8). The chimeric Ab's can be used for the treatment and prevention of thrombotic disease, especially of CC disseminated intravascular coagulation (DIC). The humanised antibody has the high hTF binding activity of the mouse monoclonal antibody but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ş

                                 express the A33 antigen. The method comprises administering an anticancer agent (I) conjugated to an immunoplobulin product (II) that binds specifically to A33 and contains one or more of I3 specified complementarity determining regions (CDRs), given in AAB98262 to AAB98274. (I) has cytostatic activity. The method can be used for treating colon and stomach cancers. (II), or the nucleic acid encoding the colon and stomach cancers. (II), or the nucleic acid encoding the cancer, and, when labeled, for detection or diagnosis of diseases associated with A33 expression. AAH22218 to AAH2224 and AAB98210 to AAB98211 represent sequences used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                    anticancer agent (I) conjugated to an immunoglobulin product (II) that binds specifically to A33 and contains one or more of 13 specified complementarity determining regions (CDRs), given in AAB98262 to AAB98274. (I) has cytostatic activity. The method can be used for treating colon and stomach cancers. (II), or the nucleic acid encoding it, can be used directly, in unconjugated form, for immunotherapy of cancer, and, when labeled, for detection or diagnosis of diseases associated with A33 expression. AAH22218 to AAH22254 and AAB98230 to AAB98231 represent sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method for treating cancers that express the A33 antigen. The method comprises administering an

                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for preparing a humanised rabbit antibody that specifically immunoreacts with a particular antigen. The method comprises expressing a library of antibodies comprising one or more complementarity determining region (CDR) from the variable domain sequences that specifically immunoreact with the antigen grafted into framework regions from humans, and selecting the antibodies that react with the antigen. The method is useful for humanising non-human mammalian antibodies, which can be used for the treatment of a variety of diseases. The present sequence represents an A33 antigen binding immunoglobulin product VLFR3 peptide which is given in an example from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Preparing humanized rabbit antibodies that specifically immunoreact with a particular antigen using display technology for expressing libraries of antibody domains and fine tuning variable domain regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chimeric antibody;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method for preparing a humanised rabbit antibody that specifically immunoreacts with a particular antigen. The method comprises expressing a library of antibodies comprising one or more complementarity determining region (CDR) from the variable domain sequences that specifically immunoreact with the antigen grafted into framework regions from humans, and selecting the antibodies that react with the antigen. The method is useful for humanising non-human mammalian antibodies, which can be used for the treatment of a variety of diseases. The present sequence represents an A33 antigen binding immunoglobulin product VLFR3 peptide which is given in an example from

AAW62793-822 represent fragments of human antibodies produced by transgenic Xenomice, created using the method of the invention. The specification describes a transgenic non-human mammal which has genome modifications that comprise an inactivated endogenous immunoglobulin (Ig) locus, so that the mammal does not display normal B-cell development. The modified genome also has an inserted human heavy chain Ig locus in germilne configuration, the human heavy chain Ig locus comprising a human micro constant region and regulatory and switch sequences, human J-H
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; immunoglobulin; Ig; transgenic; non-human mammal;

kappa light chain Ig locus; kappa constant region; J-kappa gene; V-kappa;
production; antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAKOADIW-R62920 and AAR62921-R62923 are human cytomagalovirus (HMCV) antibody heavy chain and light chain variable regions respectively. A monoclonal antibody (Mab) containing a pair of these regions can be used to detect HCMV, and anti-human HCMV Abs in human patients via a competitive immunoassay. The Mabs may also be useful in
                                                                                                                                                                                                                                                     Disclosure; Page 77; 128pp; English.

                                                                                       antibody heavy chain and light chain variable regions respectively. A monoclonal antibody (Mab) containing a pair of these regions can be used to detect HCMV, and anti-human HCMV Abs in human patients via a competitive immunoassay. The Mabs may also be useful in immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             genes, human D-H genes, and human V-H genes and an inserted human kappa light chain Ig locus in germline configuration, the human kappa light chain Ig locus comprising a human kappa constant region, J-kappa genes, and V-kappa genes, where the number of V-H and V-kappa genes inserted are selected to restore normal B-cell development in the mammal. The transgenic animals have a near complete human Ig locus, including both human heavy chain locus and a human kappa light chain locus. They can be used for the production of human antibodies when exposed to particular antigens e.g. when exposed to human II-B, EGFR or TNF- alpha respectively produce antibodies to II-B, EGFR or TNF- alpha
                                                                                                                                                                            Human monoclonal antibodies (MAbs) against human cytomegalovirus - also nucleic acids and cell lines producing the MAbs, useful in diagnosis and immunotherapy
                                                                   Sequence

The CC transgenic Xenomice, created using the method of the invention. The CC specification describes a transgenic non-human mammal which has genome CC modifications that comprise an inactivated endogenous immunoglobulin (Ig) C locus, so that the mammal does not display normal B-cell development. The CC modified genome also has an inserted human heavy chain Ig locus in micro constant region and regulatory and switch sequences, human J-H CC genes, human D-H genes, and human v-H genes and an inserted human kappa light CC chain Ig locus in germline configuration, the human kappa light CC chain Ig locus comprising a human kappa constant region, J-kappa genes, and V-kappa genes, where the number of V-H and V-kappa genes inserted are selected to restore normal B-cell development in the mammal. The CC transgenic animals have a near complete human Ig locus, including both a CC human heavy chain locus and a human kappa light chain locus. They can CC be used for the production of human antibodies when exposed to human rither alpha in the mammal of the mammal of the mammal of the mice will produce antibodies to II-8, EGFR or TNF- alpha
                                                                                                                                                                                                                                                   Matches

MAb D recognises Vibrio cholera neuraminidase-resistant epitope of ganglioside GD2, from a human melanoma cell line. MAbs A, B and C (see AAW14484-89) are mentioned in the specification, but are not part of the claims. MAbs A and B recognise specification, but are not part of the claims. MAbs A and B recognise antigens 3 and 11 resp., of a permenant human tumour cell line. MAb C alore recognises an epitope of a tumour-associated antigen. These antigens occur at high concis. In the serum of patients with gastrointestinal tumours, e.g. pancreatic carcinoma, and are thus useful as tumour markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             heavy; light chain; monoclonal antibody; antigen 3; marker; melanoma; permenant human tumour cell line; tumour associated antigen; epitope; gastrointestinal tumour; pancreatic carcinoma; diagnostic; therapeuti antigen 11; Vibrio cholera; neuraminidase-resistant; ganglioside GD2.

                                                                                                                                                                          Best Local
                                                                                                                                                                                                                                                                                                                     modified genome also has an inserted human heavy chain Ig locus in germiline configuration, the human heavy chain Ig locus comprising a human micro constant region and regulatory and switch sequences, human J-H genes, human D-H genes, and human V-H genes and an inserted human kappa light chain Ig locus in germiline configuration, the human kappa light chain Ig locus comprising a human kappa constant region, J-kappa genes, and V-kappa genes, where the number of V-H and V-kappa genes inserted are selected to restore normal B-cell development in the mammal. The transgenic animals have a near complete human Ig locus, including both a human heavy chain locus and a human kappa light chain locus. They can be used for the production of human antibodies when exposed to human II-B, ECFR or TNF- alpha respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAW62793-822 represent fragments of human antibodies produced by transgenic Xenomice, created using the method of the invention. The specification describes a transgenic non-human mammal which has genome modifications that comprise an inactivated endogenous immunoglobulin (Ig) locus, so that the mammal does not display normal B-cell development. The
                                                                                                                                                                                                                                                                Sequence

The invention relates to the construction and use of human MADS specific for the fusion (F) protein of respiratory syncytial virus (RSV) to passively treat, prevent or detect RSV infection. Hu19A, Hu19B, Hu19C and Hu19D MADS are claimed. These are reshaped human antibodies comprising a heavy chain selected from 19A, 19B, 19C or 19D (see AMM59615-18), which are based on the GL Dp58 sequence, and a light chain selected from 19A, 19B, 19C or 19D (see AMM59620-21). Such engineered antibodies are neutralising; they inhibit virus growth in vitro and in vivo in animal models of RSV infection. Nucleic acids encoding the human MADS, recombinant plasmids (see AAV41427-33) and host cells (e.g. COS, CHO, myeloma)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Monoclonal antibodies reactive with Respiratory Syncytial Virus -useful for detection, prevention and treatment of RSV infections \ensuremath{\mathsf{N}}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Fig 3; 109pp; English.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score

Ketol-acid reductoisomerase (EC 1.1.1.86) (Acetohydroxy-acid isomeroreductase) (Alpha-keto-beta-hydroxylacil reductoisomerase)
                                                                                                                                                                                    This SWISS-PROT entry is copyright. It is produced through between the Swiss Institute of Bioinformatics and the EN the European Bioinformatics Institute. There are no restruce by non-profit institutions as long as its content use by non-profit institutions as long as its content modified and this statement is not removed. Usage by and modified and this statement is not removed.
                                                                                                                                                                                                                                                                                        Submitted (DEC-1999) to the EMBL/GenBank/DDBJ databases.

-: CATALYTIC ACTIVITY: (R)-2,3-dlhydroxy-3-methylbutanoate + NADE-
-(S)-2-hydroxy-2-methyl-3-oxobutanoate + NADEH.

-: PATHWAY: VALINE AND ISOLEUCINE BIOSYNTHESIS: SECOND STEP.
-: SIMILARITY: BELONGS TO THE KETOL-ACID REDUCTOISOMERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    use by non-profit institutions as long as its content is in no way modified and this statement is not removed. TISSUE SPECIFICITY: HIGH LEVELS IN ANYGDALA, CORPUS CALLOSUM,
HIPPOCAMPUS AND SUBTHALAMIC NUCLEUS DETECTABLE IN CAUDATE
NUCLEUS, HYPOTHALAMUS AND SUBSTANTIA NIGRA,
SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
HIGHEST TO TACHYKININS RECEPTORS.

prosophila homologs of baculovirus inhibitor of apopt function to block cell death.";

cell 83:1253-125(1995).

c-1- FUNCTION: APOPTOTIC SUPPRESSOR. OVEREXPRESSION SUFFICIAL PRINCE OF TOTHE EYE.

c-1- SIMILARITY: BELONGS TO THE IAP FAMILY.

c-1- SIMILARITY: CONTAINS 1 RING-TYPE ZINC FINGER.
